1. Session Objective

The objective of Day 3 is to help participants present their experience and projects in a professional, impact-focused manner.

By the end of this session, participants will:

- Understand how to write strong experience descriptions
- Convert projects into professional case statements
- Use measurable impact in descriptions
- Position academic and personal projects effectively

2. Why Experience Section Matters

Recruiters do not just check your skills.
They evaluate how you applied them.

The Experience and Projects section answers:

- What have you built?
- What problems did you solve?
- What tools did you use?
- What results did you achieve?

3. Common Mistakes in Experience Section

- Writing only responsibilities
- Copy-pasting resume bullet points
- No measurable results
- Mentioning tools without explaining usage
- Adding projects without description

Example of Weak Description:

"Worked on web development using React and Node."

This does not show impact.

4. Professional Writing Framework (A.R.R Method)

Use this 3-step framework:

A – Action
What you did

R – Responsibility
What problem or task you handled

R – Result
What outcome or improvement happened

5. Example Transformation

Weak Version:

Developed a website using MERN stack.

Strong Version:

Developed a full-stack web application using React, Node.js, and MongoDB to manage user authentication and dashboard analytics, improving data handling efficiency by 30%.

Why this works:

- Specifies technology
- Explains purpose

- Shows measurable impact

6. How to Add Academic Projects Professionally

If you are a fresher, academic projects are valuable.

Instead of writing:

"Final year project on e-commerce website."

Write:

Designed and developed an e-commerce web application using MERN stack with secure authentication and payment integration, handling dynamic product management and order tracking.

This shows practical implementation.

7. How to Structure Each Project

For each project, include:

1. Project Title
2. Technologies Used
3. Problem Statement
4. Your Contribution
5. Result or Impact

Example:

Project: Portfolio Management System
Technologies: React, Node.js, MongoDB

Description:
Built a dynamic portfolio management system enabling users to track projects and performance metrics. Implemented REST APIs for data handling and optimized frontend rendering for better user experience.

8. Internship / Job Experience Positioning

If you have internship or job experience:

Avoid:
"Worked as an intern."

Instead write:

Worked as a Frontend Developer Intern, contributing to UI optimization and implementing responsive components using React.js, resulting in improved page load performance.

Always focus on contribution and improvement.

9. Practical Implementation Task

Participants must:

1. Rewrite at least one project using the A.R.R framework
2. Add technologies clearly
3. Include one measurable result (if possible)
4. Remove generic lines

Submission: Update LinkedIn Experience section and share link.

10. Key Takeaways

- Responsibilities do not create impact; results do
- Projects must show problem-solving ability
- Measurable statements increase credibility
- Clear structure improves recruiter understanding
